

Q1) swap these 2 variables using 2 different ways

```
let address = "ahmed";  
let name = "Egypt";
```

Q2) destructure the values (bmw , 2000cc , blue) using es6 into the showCar() function and return the right result

```
const car = {  
  name: "BMW",  
  motorCapacity: ["1600cc", "2000cc"],  
  colors: {  
    mainColors: {  
      c1: "red",  
      c2: "black",  
      otherColors: ["yellow", "orange", ["blue", "pink"]]  
    }  
  },  
}  
  
function showCar(){  
  return `the name is ${} and the motor is : ${} and the color is ${}`  
} // expected return the name is BMW and the motor is 2000CC and the color is blue
```

Q3) what's different between shallow and deep clones (explain with 2 examples)
